

McIntyre Gullies Before Pix- Gullies were 4- 8 feet deep and caused by over-grazed cattle trails. Water followed gullies into neighboring stream at bottom of hill.

May 2005

McIntyre Gullies After June 2005

Project also address runoff issue from dirt road. Water was running off and across road, creating more gullies within pasture. A rip-rap lined ditch was created, leading into a drop-box where the clean water runs through a sediment basin before entering stream. This was a 75% cost share project. Livestock exclusion from gullied treatment area will be three years to allow new growth.
